## VACCINE INFORMATION STATEMENT

Tdap Vaccine What You Need to Know

# 1 Why get vaccinated?

Tetanus, diphtheria and pertussis are very serious diseases. Tdap vaccine can protect us from these diseases. And, Tdap vaccine given to pregnant women can protect newborn babies against pertussis..

TETANUS (clock) and a segment permassion of the set of

DIPHTHERIA is also rare in the United States today. It can cause a thick coating to form in the back of the

· It can lead to breathing problems, heart failure paralysis, and death.

paralysis, and death. **PERTUSSIS** (Whooping Cough) causes severe coughing spelies, which can cause difficulty breathing, vomiting and disturbed sleep. I can also lead to weight loss, incontinence, and rib factures. Up to 2 in 100 addies weight of the 100 addies with pertussis are hospitalized or lave complications, which could include pneumonia or death.

These diseases are caused by bacteria. Diphtheria and pertussis are spread from person to person through secretions from coughing or sneezing. Tetanus enters the body through cuts, scratches, or wounds.

using introductions, sentitlehes, or wounds. Before vaccines, as many as 200,000 cases of diphtheria, 200,000 cases of pertussis, and hundreds of cases of tetanus, were reported in the United States cach year. Since vaccination began, reports of cases for tetanus and diphtheria have dropped by about 99% and for pertussis by about 80%.

(Tetanus, Diphtheria and Pertussis) Many Vaccine Information Statements an available in Spanish and other languages. See www.immunize.org.vi-Hojas de información sobre vacunas están disponibles en español y en muchos otros

## 2 Tdap vaccine

Tdap vaccine can protect adolescents and adults from tetanus, diphtheria, and pertussis. One dose of Tdap is routinely given at age 11 or 12. People who did *not* get Tdap at that age should get it as soon as possible. Tdap is especially important for healthcare professionals and anyone having close contact with a baby younger than 12 months.

Pregnant women should get a dose of Tdap during every pregnancy, to protect the newborn from pertussis. Infants are most at risk for severe, life-threatening complications from pertussis.

Another vaccine, called Td, protects against tetanus and diphtheria, but not pertussis. A Td booster should be given every 10 years. Tdap may be given as one of these boosters if you have never gotten Tdap before. Tdap may also be given after a severe cut or burn to prevent tetanus infection.

four doctor or the person giving you the vaccine can Tdap may safely be given at the same time as other

## VACCINE INFORMATION STATEMENT

Meningococcal ACWY Vaccines—MenACWY and MPSV4: What You Need to Know

#### 1 Why get vaccinated?

Meningococcal disease is a serious illness caused by a type of bacteria called Neisseria meningitidis. It can lead to meningitis (infection of the lining of the brain and spinal cord) and infections of the blood. Meningococcal disease often occurs without warning — even among people who are otherwise healthy.

Meningococcal disease can spread from person to person through close contact (coughing or kissing) or lengthy contact, especially among people living in the same household.

There are at least 12 types of *N. meningitidis*, called "scrogroups." Scrogroups A, B, C, W, and Y cause most meningococcal disease.

Anyone can get meningococcal disease but certain people are at increased risk, including

Infants younger than one year old
 Adolescents and young adults 16 through 23 years old
 People with certain medical conditions that affect the

- immune system
- Microbiologists who routinely work with isolates of N. meningitidis
   People at risk because of an outbreak in their communication.
- community Even when it is treated, meningococcal disease kills

10 to 15 infected people out of 100. And of those who survive, about 10 to 20 out of every 100 will suffer disabilities such as hearing loss, brain damage, kidney damage, amputations, nervous system problems, or severe scars from skin grafts.

Meningococcal ACWY vaccines can help prevent meningococcal disease caused by servogroups A, C, W, and Y. A different meningococcal vaccine is available to help protect against serogroup B.

Meningococcal ACWY 2 Vaccines

There are two kinds of meningococcal vaccines licensed by the Food and Drug Administration (FDA) for protection against serogroups A, C, W, and Y. meningococcal conjugate vaccine (MenACWY) and meningococcal polysaccharide vaccine (MPSV4)

Two doses of MenACWY are routinely recommended for adolescents 11 through 18 years old: the first dose at 11 or 12 years old, with a booster dose at age 16. Some adolescents, including those with HIV, should get

ity Vaccine Information Stateme itable in Spanish and other lung

additional doses. Ask your health care provider for more information. In addition to routine vaccination for adolescents, MenACWY vaccine is also recommended for certain

- groups of people: People at risk because of a serogroup A, C, W, or Y
- meningococcal disease outbreak Anyone whose spleen is damaged or has been removed · Anyone with a rare immune system condition called
- "persistent complement component deficiency" Anyone taking a drug called eculizumab (also called
- Aliyone taking a drug curve councer of a solution of the solut N. meningitidis
- Anyone traveling to, or living in, a part of the world where meningococcal disease is common, such as parts of Africa
- College freshmen living in dormitories
- · U.S. military recruits
- Children between 2 and 23 months old, and people with certain medical conditions need multiple doses for adequate protection. Ask your health care provider about the number and timing of doses, and the need for booster

doses MenACWY is the preferred vaccine for people in these groups who are 2 months through 55 years old, have received MenACWY previously, or anticipate requiring multiple doses.

MPSV4 is recommended for adults older than 55 who anticipate requiring only a single dose (travelers, or during community outbreaks).

4 Risks

with any medicine, including vaccines, there is a chance of side effects. These are usually mild and go away on their own. Serious reactions are also possible but are

## Most people who get Tdap vaccine do not hav problems with it.

- . Mild problems following Tdap (Did not interfere with activities)
- (Did not micefore with activities) adolescents or 2 in 3 aduity in Redness or so 2 in 3 aduity in Redness or so welling where the shot was given (about 1 person in 5) Mid fever of at least 100.4°F (up to about 1 in 25 adolescents or 1 in 100 adults) Headache (about 3 or 4 people in 10) Tiredness (about 1 or 4 people in 10) Tiredness (about 1 person in 3 or 4) Ausues, vormiting, diarrhea, stomach ache (up to 1 in 4 adolescents or 1 in 10 adults) Chills, sore joints (about 1 person in 3 or 4) Bady aches (about 1 person in 3 or 4)

- · Rash, swollen glands (uncommon)
- Moderate problems following Tdap (Interfered with activities, but did not require medical
- Pain where the shot was given (up to 1 in 5 or 6)
   Redness or swelling where the shot was given (up to about 1 in 16 adolescents or 1 in 12 adults)
   Fever over 102°F (about 1 in 100 adolescents or 1 in Fever 112°F (about 1 in 112°F (about 1 in 112°F (about 112°F (abou
- Fever over 102°F (about 1 in 100 adolescents or 1 in 250 adults) Headache (about 1 in 7 adolescents or 1 in 10 adults) Nausae, vomiting, diarthea, stomach ache (up to 1 or 3 people in 100) Swelling of the entire arm where the shot was given (up to about 1 in 500).
- Severe problems following Tdap (Unable to perform usual activities; required medical

- Swelling, severe pain, bleeding and redness in the arm where the shot was given (rare).
- where the shot was given (rare). **roblems that could happen after any vaccine:** People sometimes faint after a medical procedure, including vaccination. Sitting or lying down for about 15 minutes can help prevent fainting, and injuries caused by a fall. Tell your doctor if you feel dizzy, or have vision changes or ringing in the cars.
- Some people get severe pain in the shoulder and have difficulty moving the arm where a shot was given. This happens very rarely.
- Any medication can cause a severe allergic reaction. Such reactions from a vaccine are very tare, estimated at fewer than 1 in a million doses, and would happen within a few minutes to a few hours after the vaccination.

#### What if there is a serious 5 problem?

Vinat should I look for?
 Look for anything that concerns you, such as signs of a severe allergic reaction, very high fever, or unusual behavior.

Signs of a severe allergic reaction can include hives, swelling of the face and throat, difficulty breathing, a fast heartbeat, dizziness, and weakness. These would usually start a few minutes to a few hours after the vaccination.

## What should I do?

- What should 1 do? I from think it is a server allergic reaction or other emergency that can't wait, call 9-1-1 or get the person to the nearest hospital. Otherwise, call your doctor. Afterward, the reaction should be reported to the Vaccine Adverse Event Reporting System (VAERS). Your doctor might file this report, or you can do it yourself through the VAERS web site at www.vaers.hink.gov, or by calling 1-800-822-7967. VAERS does not give medical advice.

#### The National Vaccine Injury 6

Compensation Program The National Vaccine Injury Compensation (VICP) is a federal program that was create compensate people who may have been inju-certain vaccines.

Persons who believe they may have been injured by a vaccine can learn about the program and about filing a learn by calling 1-800-382-282 or visiting the VICP websile at www.hrsa.gov/vaccinecompensation. There is a time limit to file a claim for compensation.

## 7 How can I learn more?

- Ask your doctor. He or she can give you the vaccine package insert or suggest other sources of information.
   Call your local or state health department.
   Contact the Centers for Disease Control and Prevention (CDC):

Prevention (CDC); • Call **1-800-232-4636** (**1-800-CDC-INFO**) or • Visit CDC's website at **www.cdc.gov/vaccines**
